DNA encoding animal haemopoletin receptor which interacts with interleukin-13 - useful to treat asthma, allergy or condition exacerbated by JgE production

Claim 6; Page 52-54, 93pp; English.

Claim 6; Page 52-54, 93pp; English.

DNA sequences (T66164 and T66165) respectively code for novel mouse and human haemoprotein receptors (M09821 and W09822) designated NR4 that comprise the interleukin-13 (IL-13) receptor alpha-chain. A human bone marrow cDNA libgary was screened with probes comprising nucleotides 82-840 and 840-1270 of murine NR4 cDNA, and a composite sequence for human NR4 was produced from isolated clones. The

The genetic sequences can also be used in prodn. of recombinant NR4 or fusion proteins including NR4.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              that comprise the interleukin-13 (IL-13) receptor alpha-chain. To obtain the mouse sequence, genomic DNA propd. from embryonal stem cells was screened with Oligonucleotides encoding an amino acid sequence (WSDWS) found in many baemoprotein receptors. The genomic clone was used isolate NR4 cDNA clones from WEHI-3B cells, peritoneal macrophage, bone marrow, skin and kidney libraries, and a composite sequence for mouse NR4 was produced. The availability of genetic sequences for NR4 permits the development of a range of agents capable of modulating the activity of IL-13 and related cytokines such as interleukin-4 for the treatment of allergy, asthma and other conditions relating to IgE. The genetic sequences can also be used in prodn. of recombinant NR4 or fusion proteins including NR4.

Nucleic acids encoding novel secreted proteins - useful as, e.g. anti-infiammatory, immuno-stimulatory or suppressing agents Claim 45: Page 80-81; IlOpp; English.
The sequence is that of an isolated polynucleotide which may be of use in the production of therapeutic compositions for treating or smeliorating a medical condition in a mammal. Such compositions may be used for, e.g. research purposes as markers for tissues, molecular weight markers for gels, primers or probes, for insurstion as carbon, nitrogen or carbohydrate source. They can also used as a cytokine for cell proliferation and differentiation activi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PT New polynucleotides encoding human secreted proteins - derived from PT e.g. human blood, kidney, foetal lung, placenta, testes, brain, provary, pituitary, retina and colon cDNA libraries.

PS Claim 1; Page 288; Si8pp: English.

CC The present sequence represents a human expressed sequence tag (EST).

CC The present sequence represents a human expressed sequence tag (EST).

CC The polynucleotide, which is a secreted EST, and the encoded protein conditions in human and animals altivities which would make conditions in humans and animals, although no supporting data is conditions in humans and animals, although no supporting data is conditions in humans and animals, although no supporting data is conditions in humans and animals, although no supporting data is conditions in suppressing activity, haematopoiesis regulating conditivity, tissue growth activity, activin/inhibin activity, chemotactic/chemokinetic activity, activin/inhibin activity, cativity, thaemostatic and thrombolytic activity, respector/ligand activity, haematopoiesis regulation conditions in vasion suppressor activity, tumour inhibition conditions in vasion suppressor activity, tumour inhibition conditions in vasion suppressor activity, tumour inhibition conditions in vasion suppressor activity.

Such compositions may be used for, e.g. research purposes as markers for tissues, molecular weight markers for gels, primers or probes, for nutrition as carbon, nitrogen or carbohydrate source. They can also be used as a cytckine for cell proliferation and differentiation activity, as immune stimulants or suppressors, e.g. for viral, bacterial or fungal infections, for autoimmune diseases such as multiple sclerosis or systemic lupus erythematosus, to regulate haematopolesis, for tissue growth, as an activator or inhibitor, or as a chemotactic or chemokinetic, haemostatic and thrombocytic, receptor/ligand, anti-inflammatory or tumour inhibitor agents.

                               Nucleic acids encoding novel secreted proteins - useful as, e.g. anti-inflammatory, immuno-stimulatory or suppressing agents Claim 45; Page 82; 110pp; English.

The sequence is that of an isolated polynucleotide which may be of use in the production of therapeutic compositions for treating or ameliorating a medical condition in a mammal. Such compositions may be used for, e.g. research purposes as markers tissues, molecular weight markers for gels, primers or probes, for the production of the production of the production in a mammal.

CC A single-stranded DNA (or its complementary strand or the corresp.

CC double-stranded DNA) which comprises one of the 7837 "GS" sequences

CC given in T19001-T26837 and which is able to hybridise to part of

CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)

CC sequences were obtained from 3'-directed cDNA ilbraries prepared

CC 1'-cend of mRNA by using poly(T) as the sole primer. Since the 3'-

CC untranslated sequence is unique to a particular mRNA species, almost

CC all the 3'-oriented cDNAs hybridise with specific mRNAs. Each ilbrary

CC ils constructed so as to reflect accurately the relative abundance of

CC different mRNAs in the particular tissue from which it was derived.

CC The appearance frequency of a given GS in a CDNA library can be

CC sequences) as a means of diagnosing abnormal cell function or for

CC sequences as a means of diagnosing abnormal cell function or for

propersise protein (1A7pp; English.

CC This sequence encodes the human HIAP-1 protein, which is a inhibitor of CC apoptosis protein (IAP), and can be used in the method of the invention. CC apoptosis protein (IAP), and can be used in the method of the invention. CC apoptosis protein (IAP), and can be used in the method of the invention. CC proliferative disease by treatment with a compound that inhibits compounds are used to treat proliferative diseases, specially cancers of compounds are used to treat proliferative diseases, specially cancers of cretum, cervix or endometrium, particularly to increase their sensitivity of chemotherapeutic agents. High levels of the IAP or NAIP proteins are selected in many cancers and are associated with poor prognosis, consisted that wild-type p53 suppresses transcription of the IAP or NAIP proteins and colon, are used to chemotherapeutic agents and mutations in p53 (it is genes). Transgenic animals are used for testing the effects of antisense colon colons.

CC This is the human SHOX gene sequence containing the PAR1 region. The gene CC region corresponding to short stature has been identified as a region of genes in this region have been identified as candidates for the short CC stature gene. These genes were designated SHOX (also referred to as SHOX93) or HOX93), pET92 and SHOT (SHOX-like homeobox gene on chromosome CC variations SHOXa and SHOXb. The specification provides sequences of SHOX (short stature homeobox-containing) genes SHOX ET92, SHOXA, SHOXb, SHOT CC sequences of the SHOX genes as shown in V35621 and protein CC and SHOT as shown W60573 to W60575. The novel genes are responsible for Treatment of short stature or other human growth genes short stature, e.g. CC treatment of short stature or other human growth disorders. The products can be used to develop agents for the CC can also be used for providing a mitogenic effect on cells, e.g. for the with disturbance in the bone calcium regulation.

Disclosure; Pages 37-45; 84pp; English.

This is a preliminary nucleotide sequence of the SHOX gene. The gene region corresponding to short stature has been identified as a region approximately 500 kb in the PARI region of the X and Y chromosomes. The genes in this region have been identified as candidates for the short

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (short stature homeobox-containing) genes SHOX ET92, SHOXA, SHOXD SHOT and exons of the SHOX genes as shown in V35610 to V35621 and protein sequence. For fithe human growth protein transcription factor SHOXA, SHOXD and SHOYT is shown W60573 to W60575. The novel genes are responsible for human growth: Defects in the genes can cause short stature, e.g. Turner's syndrome. The products can be used to develop agents for the treatment of short stature or other human growth disorders. The products car also be used for providing a mitogenic effect on cells, e.g. for the treitment of bone diseases such as osteoporosis and diseases involved with disturbance in the bone calcium regulation.

Genes and proteins encoding cytokine synthesis inhibitory factors - useful in treating diseases associated with cytokine imbalances, e.g. parasitic infections and auto-immune disorders Claim 1; Fig 4; 23pp; English.

A human T cell cDNA library was screened with probes based on the murine CSIF gene. Two clones carrying plasmids pH5C and pH15C were identified. (These two expression vectors are claimed). The CSIF polypeptide they encode inhibits synthesis of cytokines associated with delayed type hypersensitivity responses. CSIF (also called II-10) can be used to treat diseases associated with cytokine

C: This is the human SHOX gene sequence containing the PAR1 region. The gene corresponding to show that has been identified as a region of approximately 500 kb in the PAR1 region of the X and Y chromosomes. Three cidents in this region have been identified as candidates for the short contained the part of the X and Y chromosomes. Three cidents in this region have been identified as candidates for the short contained to as sequenced to as sequenced to a sequence of the SHOX gene has two separate splicing sites resulting in two contained to the SHOX and SHOX and SHOX peres as shown in V5611 and protein contained the show of the SHOX genes as shown in V5611 to V5561 and protein contained the shown with protein transcription factor SHOXA, SHOXD cond store of the SHOX genes as shown in V5610 to V5561 and protein contained the shown with protein transcription factor SHOXA, SHOXD cond SHOY as shown with SHOY5. The novel genes are responsible for human growth. Defects in the genes can cause short stature, e.g.

C: Turner's syndrome. The products can be used to develop agents for the products.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (short stature homeobox-containing) genes SHOX ET92, SHOXA, SHOXD, SHOT and exons of the SHOX genes as shown in V35610 to V35621 and protein sequences of the human growth protein transcription factor SHOXA, SHOXD and SHOT as shown W60573 to W60575. The novel genes are responsible for human growth. Defects in the genes can cause short stature, e.g. Turner's syndrome. The products can be used to develop agents for the treatment of short stature or other human growth disorders. The products can use one used for providing a mitogenic effect on cells, e.g. for the treatment of bone diseases such as osteoporosis and diseases involved with disturbance in the bone calcium regulation.

The gene region corresponding to short stature has been identified as a region of approximate; 500 kb in the PARI region of the X and Y chromosomes. Thre genes in the region have been identified as candidates for the short stature gene. These genes were designated SHOX (also referred to as SHOX) or ECX93), pET92 and SHOT (SHOX-like homeobox gene on chromosome three thre

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library went through one round of normalization.

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 260232-265223, 340488-345479, and 484488-489479."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /map="917A12; 1; 858G08; 902A12; 960E05; 1q31.3-1q32.1q31.3-1q32.1; 1q31.3-1q32.1" | 1q31.3

                                                                                                                                                                                                                                                                                                                                         /note="vector: pspOrT1; Site_1: SalI; Site_2: NotI; RNA
was prepared from a pool of 6 anonymous Wilms' tumor RNAs.
RNA was prepared by acid-phenol, followed by one round of
oligo dT selection. cDNA library preparation was with
the BRL/Life Tech. Superscript plasmid system. An
oligo-dT NotI primer for first strand synthesis generated
gcggccgcc(t)n at the 3' end of the clones. A 5' SalI
adaptor was used with sequence 5'-gtcgaccacggctccg-3'.
Resulting cDNAs were size selected (average size 2 kb),
NotI digested, and ligated into NotI/SalI-cut pspORT1.
Library was constructed by Dr. Manfred Gessler."

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

## ALIGNMENTS

```
The present sequence represents the human interleukin-13 (IL-13) binding chain of the interleukin-13 receptor, designated IL-13bc. IL-13bc acts a mediator of the known biological activities of IL-13. Recombinant IL-13bc proteins, and antibodies raised against them, are used to inhibit the binding of IL-13 to its receptor. They are particularly used to treat IgE-mediated conditions, e.g. allergy, asthma and immune complex disorders, especially lupus, nephritis, thyroiditis and drawe's disease. They are also used to treat immune deficiency (particularly in haematopoietic progenitor cells), cancer etc., and to increase macrophage activation, e.g. in vaccingtion. To potentiate IL-13 activity, a protein with such activity is combined with IL-13bc and the mixture applied, in vivo, to activity is combined with IL-13bc and the mixture applied, in vivo, to cell expressing at least one chain of the IL-13 receptor other than IL-13bc. IL-13bc can also be used in diagnosis to detect antibodies which may be useful for treating some tumours.
